(54) Title: **PSEUDOPOLYMORPHIC FORMS OF A HIV PROTEASE INHIBITOR**

(57) Abstract: New pseudopolymorphic forms of (3R,3aS,6aR)-hexahydrofuro [2,3-b] furan-3-yl (1S,2R)-3-[[[4-aminophenyl)sulfonyl](isobutyl)amino]-I-benzyl-2hydroxypropylcarbamate and processes for producing them are disclosed.

WO 03/106461 A2

PSEUDOPOLYMORPHIC FORMS OF A HIV PROTEASE INHIBITOR

Technical Field

- 5 This invention relates to novel pseudopolymorphic forms of (3R,3aS,6aR)-hexahydro-furo [2,3-b] furan-3-yl (1S,2R)-3-[[[4-aminophenyl] sulfonyl] (isobutyl) amino]-1-benzyl-2-hydroxypropylcarbamate, a method for their preparation as well as their use as a medicament.

Background of the invention

Virus-encoded proteases, which are essential for viral replication, are required for the processing of viral protein precursors. Interference with the processing of protein precursors inhibits the formation of infectious virions. Accordingly, inhibitors of viral proteases may be used to prevent or treat chronic and acute viral infections.

- 15 (3R,3aS,6aR)-hexahydrofuro [2,3-b] furan-3-yl (1S,2R)-3-[[[4-aminophenyl] sulfonyl] (isobutyl) amino]-1-benzyl-2-hydroxypropylcarbamate has HIV protease inhibitory activity and is particularly well suited for inhibiting HIV-1 and HIV-2 viruses.

- 20 The structure of (3R,3aS,6aR)-hexahydrofuro [2,3-b] furan-3-yl (1S,2R)-3-[[[4-aminophenyl] sulfonyl] (isobutyl) amino]-1-benzyl-2-hydroxypropylcarbamate, is shown below:

Formula (X)

- Compound of formula (X) and processes for its preparation are disclosed in EP 715618, 25 WO 99/67417, US 6,248,775, and in Bioorganic and Chemistry Letters, Vol. 8, pp. 687-690, 1998, "Potent HIV protease inhibitors incorporating high-affinity P₂-ligands and (R)-(hydroxyethylamino)sulfonamide isostere", all of which are incorporated herein by reference.

- 30 Drugs utilized in the preparation of pharmaceutical formulations for commercial use

must meet certain standards, including GMP (Good Manufacturing Practices) and ICH (International Conference on Harmonization) guidelines. Such standards include technical requirements that encompass a heterogeneous and wide range of physical, chemical and pharmaceutical parameters. It is this variety of parameters to consider,
5 which make pharmaceutical formulations a complex technical discipline.

For instance, and as example, a drug utilized for the preparation of pharmaceutical formulations should meet an acceptable purity. There are established guidelines that define the limits and qualification of impurities in new drug substances produced by
10 chemical synthesis, i.e. actual and potential impurities most likely to arise during the synthesis, purification, and storage of the new drug substance. Guidelines are instituted for the amount of allowed degradation products of the drug substance, or reaction products of the drug substance with an excipient and/or immediate container/closure system.

15 Stability is also a parameter considered in creating pharmaceutical formulations. A good stability will ensure that the desired chemical integrity of drug substances is maintained during the shelf-life of the pharmaceutical formulation, which is the time frame over which a product can be relied upon to retain its quality characteristics when
20 stored under expected or directed storage conditions. During this period the drug may be administered with little or no risk, as the presence of potentially dangerous degradation products does not pose prejudicial consequences to the health of the receiver, nor the lower content of the active ingredient could cause under-medication.

25 Different factors, such as light radiation, temperature, oxygen, humidity, pH sensitivity in solutions, may influence stability and may determine shelf-life and storage conditions.

Bioavailability is also a parameter to consider in drug delivery design of
30 pharmaceutically acceptable formulations. Bioavailability is concerned with the quantity and rate at which the intact form of a particular drug appears in the systemic circulation following administration of the drug. The bioavailability exhibited by a drug is thus of relevance in determining whether a therapeutically effective concentration is achieved at the site(s) of action of the drug.

35 Physico-chemical factors and the pharmaco-technical formulation can have repercussions in the bioavailability of the drug. As such, several properties of the drug such as dissociation constant, dissolution rate, solubility, polymorphic form, particle size, are to be considered when improving the bioavailability.

It is also relevant to establish that the selected pharmaceutical formulation is capable of manufacture, more suitably, of large-scale manufacture.

- 5 In view of the various and many technical requirements, and its influencing parameters, it is not obvious to foresee which pharmaceutical formulations will be acceptable. As such, it was unexpectedly found that certain modifications of the solid state of compound of formula (X) positively influenced its applicability in pharmaceutical formulations.

10

Summary of the invention

Present invention concerns pseudopolymorphic forms of compound of formula (X) for the preparation of pharmaceutical formulations. Such pseudopolymorphic forms contribute to pharmaceutical formulations in improved stability and bioavailability.

- 15 They can be manufactured in sufficient high purity to be acceptable for pharmaceutical use, more particularly in the manufacture of a medicament for inhibiting HIV protease activity in mammals.

In a first aspect, the present invention provides pseudopolymorphs of (3R,3aS,6aR)-hexahydrofuro [2,3-b] furan-3-yl (1S,2R)-3-[[[(4-aminophenyl) sulfonyl] (isobutyl) amino]-1-benzyl-2-hydroxypropylcarbamate.

20 Pseudopolymorphs provided include alcohol solvates, more in particular, C1-C4 alcohol solvates; hydrate solvates; alkane solvates, more in particular, C1-C4 chloroalkane solvates; ketone solvates, more in particular, C1-C5 ketone solvates; ether solvates, more in particular, C1-C4 ether solvates; cycloether solvates; ester solvates, more in particular, C1-C5 ester solvates; and sulfonic solvates, more in particular, C1-4 sulfonic solvates, of the compound of formula (X). Preferred pseudopolymorphs are pharmaceutically acceptable solvates, such as hydrate and ethanolate.

25 Particular pseudopolymorphs are Form A (ethanolate), Form B (hydrate), Form C (methanolate), Form D (acetate), Form E (dichloromethanate), Form F (ethylacetate solvate), Form G (1-methoxy-2-propanolate), Form H (anisolate), Form I (tetrahydrofuranate), Form J (isopropanolate) of compound of formula (X). Another particular pseudopolymorph is Form K (mesylate) of compound of formula (X).

- 30 In a second aspect, present invention relates to processes for preparing pseudopolymorphs. Pseudopolymorphs of compound of formula (X) are prepared by combining compound of formula (X) with an organic solvent, water, or mixtures of water and water miscible organic solvents, and applying any suitable technique to induce crystallization, to obtain the desired pseudopolymorphs.

In a third aspect, the invention relates to the use of the present pseudopolymorphs, in the manufacture of pharmaceutical formulations for inhibiting HIV protease activity in mammals. In relation to the therapeutic field, a preferred embodiment of this invention relates to the use of pharmaceutically acceptable pseudopolymorphic forms of compound of formula (X) for the treatment of an HIV viral disease in a mammal in need thereof, which method comprises administering to said mammal an effective amount of a pharmaceutically acceptable pseudopolymorphic form of compound of formula (X).

The following drawings provide additional information on the characteristics of the pseudopolymorphs according to present invention.

Brief Description of the Drawings

Detailed description

25 The term “polymorphism” refers to the capacity of a chemical structure to occur in different forms and is known to occur in many organic compounds including drugs. As such, “polymorphic forms” or “polymorphs” include drug substances that appear in amorphous form, in crystalline form, in anhydrous form, at various degrees of hydration or solvation, with entrapped solvent molecules, as well as substances varying
30 in crystal hardness, shape and size. The different polymorphs vary in physical properties such as solubility, dissolution, solid-state stability as well as processing behaviour in terms of powder flow and compaction during tableting.

The term “amorphous form” is defined as a form in which a three-dimensional long-range order does not exist. In the amorphous form the position of the molecules
35 relative to one another are essentially random, i.e. without regular arrangement of the molecules on a lattice structure.

The term "crystalline" is defined as a form in which the position of the molecules relative to one another is organised according to a three-dimensional lattice structure.

The term "anhydrous form" refers to a particular form essentially free of water.

5 "Hydration" refers to the process of adding water molecules to a substance that occurs in a particular form and "hydrates" are substances that are formed by adding water molecules. "Solvating" refers to the process of incorporating molecules of a solvent into a substance occurring in a crystalline form. Therefore, the term "solvate" is defined as a crystal form that contains either stoichiometric or non-stoichiometric
10 amounts of solvent. Since water is a solvent, solvates also include hydrates. The term "pseudopolymorph" is applied to polymorphic crystalline forms that have solvent molecules incorporated in their lattice structures. The term pseudopolymorphism is used frequently to designate solvates (Byrn, Pfeiffer, Stowell, (1999) *Solid-state Chemistry of Drugs*, 2nd Ed., published by SSCI, Inc).

15 The present invention provides pseudopolymorphs of (3R,3aS,6aR)-hexahydrofuro [2,3-b] furan-3-yl (1S,2R)-3-[[[4-aminophenyl] sulfonyl] (isobutyl) amino]-1-benzyl-2-hydroxypropylcarbamate.

20 In one embodiment pseudopolymorphs are alcohol solvates, more in particular, C₁-C₄ alcohol solvates; hydrate solvates; alkane solvates, more in particular, C₁-C₄ chloroalkane solvates; ketone solvates, more in particular, C₁-C₅ ketone solvates; ether solvates, more in particular C₁-C₄ ether solvates; cycloether solvates; ester solvates, more in particular C₁-C₅ ester solvates; or sulfonic solvates, more in particular, C₁-C₄
25 sulfonic solvates, of the compound of formula (X). The term "C₁-C₄ alcohol" defines straight and/or branched chained saturated and unsaturated hydrocarbons having from 1 to 4 carbon atoms substituted with at least a hydroxyl group, and optionally substituted with an alkyloxy group, such as, for example, methanol, ethanol, isopropanol, butanol, 1-methoxy-2-propanol and the like. The term "C₁-C₄ chloroalkane" defines straight
30 and/or branched chained saturated and unsaturated hydrocarbons having from 1 to 4 carbon atoms substituted with at least one chloro atom, such as, for example, dichloromethane. The term "C₁-C₅ ketone" defines solvents of the general formula R'-C(=O)-R wherein R and R' can be the same or different and are methyl or ethyl, such as, acetone and the like. The term "C₁-C₄ ether" defines solvents of the general
35 formula R'-O-R wherein R and R' can be the same or different and are a phenyl group, methyl or ethyl, such as, anisole and the like. The term "cycloether" defines a 4- to 6-membered monocyclic hydrocarbons containing one or two oxygen ring atoms, such as tetrahydrofuran and the like. The term "C₁-C₅ ester" defines solvents of the general

formula $R'-O-C(=O)-R$ wherein R and R' can be the same or different and are methyl or ethyl, such as ethylacetate and the like. The term "C₁-C₄ sulfonic solvent" defines solvents of the general formula R-SO₃H wherein R can be a straight or branched chained saturated hydrocarbon having from 1 to 4 carbon atoms, such as mesylate, ethanesulfonate, butanesulfonate, 2-methyl-1-propanesulfonate, and the like.

Pseudopolymorphs of the present invention, which are pharmaceutically acceptable, for instance hydrates, alcohol solvates, such as, ethanolate, are preferred forms.

Several pseudopolymorphs are exemplified in this application and include Form A (ethanolate), Form B (hydrate), Form C (methanolate), Form D (acetate), Form E (dichloromethanate), Form F (ethylacetate solvate), Form G (1-methoxy-2-propanolate), Form H (anisolate), Form I (tetrahydrofuranate), Form J (isopropanolate), or Form K (mesylate) of compound of formula (X).

Solvates can occur in different ratios of solvation. Solvent content of the crystal may vary in different ratios depending on the conditions applied. Solvate crystal forms of compound of formula (X) may comprise up to 5 molecules of solvent per molecule of compound of formula (X), appearing in different solvated states including, amongst others, hemisolvate, monosolvate, disolvate, trisolvate crystals, intermediate solvates crystals, and mixtures thereof. Conveniently, the ratio of compound of formula (X) to the solvent may range between (5:1) and (1:5). In particular, the ratio may range from about 0.2 to about 3 molecules of solvent per 1 molecule of compound of formula (X), more in particular, the ratio may range from about 1 to about 2 molecules of solvent per 1 molecule of compound of formula (X), preferably the ratio is 1 molecule of solvent per 1 molecule of compound of formula (X).

Solvates may also occur at different levels of hydration. As such, solvate crystal forms of compound of formula (X) may in addition comprise under certain circumstances, water molecules partially or fully in the crystal structures. Consequently, the term "Form A" will be used herein to refer to the ethanolate forms of compound of formula (X) comprising up to 5 molecules of solvent per 1 molecule of compound of formula (X), intermediate solvates crystals, and the mixtures thereof; and optionally comprising additional water molecules, partially or fully in the crystal structures. The same applies for Form B through Form K. In case a particular "Form A" needs to be denoted, the ratio of solvation will follow the "Form A", for instance, one molecule of ethanol per one molecule of compound (X) is denoted as Form A (1:1).

The X-ray powder diffraction is a technique to characterise polymorphic forms

including pseudopolymorphs of compound of formula (X) and to differentiate solvate crystal forms from other crystal and non-crystal forms of compound of formula (X). As such, X-ray powder diffraction spectra were collected on a Phillips PW 1050/80 powder diffractometer, model Bragg-Brentano. Powders of Form A (1:1), around 200 mg each sample, were packed in 0.5 mm glass capillary tubes and were analysed according to a standard method in the art. The X-ray generator was operated at 45 Kv and 32 mA, using the copper $K\alpha$ line as the radiation source. There was no rotation of the sample along the chi axis and data was collected between 4 and 60° 2-theta step size. Form A (1:1) has the characteristic two-theta angle positions of peaks as shown in FIG. 1, 2 and 3 at: 7,04° ± 0,5°, 9,24° ± 0,5°, 9,96° ± 0,5°, 10,66° ± 0,5°, 11,30° ± 0,5°, 12,82° ± 0,5°, 13,80° ± 0,5°, 14,56° ± 0,5°, 16,66° ± 0,5°, 17,30° ± 0,5°, 18,28° ± 0,5°, 19,10° ± 0,5°, 20,00° ± 0,5°, 20,50° ± 0,5°, 21,22° ± 0,5°, 22,68° ± 0,5°, 23,08° ± 0,5°, 23,66° ± 0,5°, 25,08° ± 0,5°, 25,58° ± 0,5°, 26,28° ± 0,5°, 27,18° ± 0,5°, 28,22° ± 0,5°, 30,20° ± 0,5°, 31,34° ± 0,5°, 32,68° ± 0,5°, 33,82° ± 0,5°, 39,18° ± 0,5°, 41,20° ± 0,5°, 42,06° ± 0,5°, and 48,74° ± 0,5°.

In another set of analytical experiments, X-ray single diffraction was applied to Form A (1:1), which resulted in the following crystal configuration, listed in the table below.

Table 3 shows the anisotropic displacement parameters ($\text{\AA}^2 \times 10^3$) for Form A (1:1).

The anisotropic displacement factor exponent takes the formula:

$$-2\pi^2[h^2 a^{*2} U_{11} + \dots + 2 h k a^* b^* U_{12}]$$

5

| | U_{11} | U_{22} | U_{33} | U_{23} | U_{13} | U_{12} |

Raman spectroscopy has been widely used to elucidate molecular structures, crystallinity and polymorphism. The low-frequency Raman modes are particularly

useful in distinguishing different molecular packings in crystal. As such, Raman spectra were recorded on a Bruker FT-Raman RFS100 spectrometer equipped with a photomultiplier tube and optical multichannel detectors. Samples placed in quartz capillary tubes were excited by an argon ion laser. The laser power at the samples was adjusted to about 100 mW and the spectral resolution was about 2 cm⁻¹. It was found that Forms A, B, D, E, F, and H, (1:1) and the amorphous form have the Raman spectra which appear in Figures 5, 6, and 7.

In addition, Forms A and B were characterized using a μ ATR (Micro-Attenuated Total Reflectance) accessory (Harrick Split-Pea with Si crystal). The infrared spectra were obtained with a Nicolet Magna 560 FTIR spectrophotometer, a Ge on KBr beamsplitter, and a DTGS with KBr windows detector. Spectra were measured at 1 cm⁻¹ resolution and 32 scans each, in a wavelength range of from 4000 to 400 cm⁻¹, and application of baseline correction. The wavenumbers for Form A obtained are exhibited in the following Table 4.

Table 4

| Wavenumbers (cm ⁻¹) and relative intensities of absorption bands (¹) |

⁽¹⁾ vs = very strong, s = strong, m = medium, w = weak, vw = very weak, br = broad

The IR spectrum in Figure 10 reflects the vibrational modes of the molecular structure of Form B as a crystalline product.

- 5 Following the same analytical IR method, Form B and the amorphous form were also characterised and compared with Form A, as shown in Figures 11 to 14. IR spectra of the different physical forms showed distinct spectral differences, most relevant are those in Table 6:

10 Table 6

| Wavenumbers (cm ⁻¹) and relative intensities of absorption bands ⁽¹⁾ | | |

⁽¹⁾ s = strong, m = medium, w = weak, vw = very weak, br = broad

The physical Forms A, B, and amorphous form are identified through spectral interpretation, focused on absorption bands specific for each form. Unique and specific spectral differences between forms are noticed in 3 spectral ranges: from 3750 to 2650 cm^{-1} (range 1), from 1760 to 1580 cm^{-1} (range 2) and from 980 to 720 cm^{-1} (range 3).

Range 1 (from 3750 to 2650 cm^{-1})

Figure 11: Form A shows a double band with absorption maxima at 3454 cm^{-1} and 3429 cm^{-1} . Form B shows a single absorption band at 3615 cm^{-1} and amorphous form shows a single absorption band at 3362 cm^{-1} .

Range 2 (from 1760 to 1580 cm^{-1})

Figure 12: Form A shows a single absorption band at 1646 cm^{-1} , Form B shows a single absorption band at 1630 cm^{-1} and amorphous form shows a single absorption band at 1628 cm^{-1} with a clearly higher intensity compared to the Form B band.

Additionally, amorphous form shows a less intense, broad band at 1704 cm^{-1}

compared to both forms A and B bands at about 1704 cm^{-1} .

Range 3 (from 980 to 720 cm^{-1})

Figure 13: Form A shows a distinct set of 5 absorption bands at 911, 890, 876, 862 and 841 cm^{-1} . Form B shows a similar set but the 876 cm^{-1} band is missing. Amorphous form shows a single broad band at about 750 cm^{-1} , both forms A and B show two maxima at about 768 cm^{-1} and 743 cm^{-1} .

Thermomicroscopy is another useful technique in the study of solid-state kinetics. The kinetics of nucleation processes from solutions or melts, including the analysis of the nucleation speed, can be quantified. The simplest and most widely used method is the melting point determination. As such, a Mettler model FP 82 controller with heating stage was used on a Leitz microscope. A few particles of Form A were placed on a glass slide and observed while heating at 10°C per minute. The melting range for Form A (1:1) was found to be between 90° and 110° C.

On another means of characterization, the solubility of Form A (1:1) was also a matter subject to study. Its solubility in different solvents at approximate 23°C was determined to be as follows:

Table 7: Approximate solubility for Form A (1:1), in mg/ml

| Solvent | Approximate solubility Form A (mg/ml) |
|-----------------|--|
| Acetone | 106 – 211 |
| Dichloromethane | 105 – 209 |

| Solvent | Approximate solubility Form A (mg/ml) |
|----------------------|--|
| 1-Methoxy-2-propanol | 160 – 213 |
| Ethylmethylketone | 102 – 204 |
| Ethylacetate | 71 – 107 |
| Ethanol absolute | < 3.4 |
| Heptane | < 3.4 |
| Water | < 3.5 |
| Isopropylether | < 3.4 |
| Methacrylate | > 200 |
| Methanol | < 3.4 |
| 2-Propanol | < 3.4 |
| Tetrahydrofurane | 102 – 203 |
| Toluene | < 3.5 |

Further solubility investigations were performed in function of pH. As such, the aqueous solubilities of Form A (1:1) were measured in solvents with different pH. An excess of the solute was equilibrated with the solvent at 20°C for at least 24 hours.

- 5 After removing the undissolved compound, the concentration in solution was determined using UV spectrometry.

Table 8: Solubility for Form A (1:1) in function of pH

| Solvent | Solubility (mg / 100 ml solution) | |
|---------------------------|-----------------------------------|----------|
| Water | 16 | (pH 5.9) |
| Buffer pH 2 (citrate/HCl) | 18 | (pH 2.0) |
| Buffer pH 3 (citrate/HCl) | 10 | (pH 3.0) |
| Buffer pH 4 (citrate/HCl) | 9 | (pH 4.0) |
| 0.01N HCl | 18 | (pH 2.1) |
| 0.1N HCl | 83 | (pH 1.1) |
| 1.0N HCl | 620 | (pH 0.2) |

- 10 Solubility of Form A (1:1) in function of HP β CD (hydroxypropyl- β -cyclodextrin) was measured. An excess of product was equilibrated with the solvent during 2 days at 20°C. After removing the undissolved compound, the concentration in solution was determined using UV spectrometry.

- 15 Table 9: Solubility for Form A (1:1) in function of HP β CD

| solvent | Solubility in mg/ml solution | |
|----------------------------|------------------------------|----------|
| Water | 0.16 | (pH=5.9) |
| 5% HP β CD in water | 2.4 | (pH=5.8) |
| 10% HP β CD in water | 6.5 | (pH=6.0) |
| 20% HP β CD in water | 17 | (pH=6.0) |
| 40% HP β CD in water | 40 | (pH=5.9) |

In a second aspect, the present invention relates to processes for preparing pseudopolymorphs. Pseudopolymorphs of compound of formula (X) are prepared by combining compound of formula (X) with an organic solvent, or water, or mixtures of water and water miscible organic solvents, applying any suitable technique to induce crystallization, and isolating the desired pseudopolymorphs.

By techniques for inducing crystallization are to be understood those processes for the production of crystals, which include amongst others, dissolving or dispersing compound of formula (X) in a solvent medium, bringing the solution or dispersion of compound of formula (X) and the solvent(s) to a desired concentration, bringing the said solution or dispersion to a desired temperature, effecting any suitable pressure, removing and/or separating any undesired material or impurities, drying the formed crystals to obtain the pseudopolymorphs in a solid state, if such state is desired.

Bringing the solution or dispersion of compound of formula (X) and solvents to a desired concentration does not necessarily imply an increase in the concentration of compound of formula (X). In certain cases, a decrease or no change in concentration could be preferable. By bringing the said solution or dispersion to a desired temperature, one will understand the acts of heating, cooling or leaving at ambient temperature.

The techniques used for obtaining a desired concentration are those common in the art, for instance, evaporation by atmospheric distillation, vacuum distillation, fractioned distillation, azeotropic distillation, film evaporation, other techniques well known in the art and combinations thereof. An optional process for obtaining a desired concentration could as well involve the saturation of the solution of compound of formula (X) and solvent, for example, by adding a sufficient volume of a non-solvent to the solution to reach the saturation point. Other suitable techniques for saturating the solution include, by way of example, the introduction of additional compound of formula (X) to the solution and/or evaporation of a portion of the solvent from the solution. As referred to

herein, saturated solution encompasses solutions at their saturation points or exceeding their saturation points, i.e. supersaturated.

5 Removing and/or separating any undesired material or impurities may be performed by purification, filtering, washing, precipitation or similar techniques. Separation, for example, can be conducted by known solid-liquid separation techniques. Filtering procedures known to those skilled in the art can as well be used in the present process. The filtrations can be performed, amongst other methods, by centrifugation, or using Buchner style filter, Rosenmund filter or plates, or frame press. Preferably, in-line
10 filtration or safety filtration may be advantageously intercalated in the processes disclosed above, in order to increase the purity of the resulting pseudopolymorphic form. Additionally, filtering agents such as silica gel, Arbocel®, dicalite diatomite, or the like, may also be employed to separate impurities from the crystals of interest.

15 Crystals obtained may be also dried, and such drying process may optionally be used in the different crystallization passages, if more than one crystallization passage is applied. Drying procedures include all techniques known to those skilled in the art, such as heating, applying vacuum, circulating air or gas, adding a desiccant, freeze-drying, spray-drying, evaporating, or the like, or any combination thereof.

20 Processes for crystallization of pseudopolymorphs of compound of formula (X) embrace multiple combinations of techniques and variations thereof. As such, and by way of example, crystallization of pseudopolymorphs of compound of formula (X) may be executed by dissolving or dispersing compound of formula (X) at a suitable
25 temperature in the solvent whereby portion of the said solvent evaporates increasing the concentration of the compound of formula (X) in the said solution or dispersion, cooling the said mixture, and optionally washing and/or filtering and drying resulting solvate crystals of compound of formula (X). Optionally, pseudopolymorphs of compound of formula (X) may be prepared by dissolving or dispersing compound of
30 formula (X) in a solvent medium, cooling said solution or dispersion and subsequently filtering and drying the obtained pseudopolymorph. Another example of preparation of solvates of compound of formula (X) could be by saturating compound of formula (X) in the solvent medium, and optionally filtering, washing and drying obtained crystals.

35 Crystal formation may as well involve more than one crystallization process. In certain cases, one, two or more extra crystallization steps may be advantageously performed for different reasons, such as, to increase the quality of the resulting solvate. For instance, pseudopolymorphs of the present invention could also be prepared by adding a solvent to an initial starting base material of compound of formula (X), stirring the

solution at a fixed temperature until the substances would be fully solved, concentrating the solution by vacuum distillation, and cooling. A first crystallization would take place and the formed crystals would be newly washed with a solvent, and followed by dissolution of compound of formula (X) with the solvent to form the desired

5 pseudopolymorph. Recrystallization of the reaction mixture would occur, followed by a cooling step from reflux. The formed pseudopolymorph would optionally be filtered and allowed to dry.

10 By dissolving or dispersing compound of formula (X) in the organic solvent, water or a mixture of water and water miscible organic solvents, one may obtain different degrees of dispersion, such as suspensions, emulsions, slurries or mixtures; or preferably obtain homogeneous one-phase solutions.

15 Optionally, the solvent medium may contain additives, for example one or more dispersing agents, surfactants or other additives, or mixtures thereof of the type normally used in the preparation of crystalline suspensions and which are well documented in the literature. The additives may be advantageously used in modifying the shape of crystal by increasing the leniency and decreasing the surface area.

20 The solvent medium containing the solution may optionally be stirred for a certain period of time, or vigorously agitated using, for example, a high shear mixer or homogeniser or a combination of these, to generate the desired droplet size for the organic compound.

25 Examples of organic solvents useful for the present invention include C₁-C₄ alcohols such as methanol, ethanol, isopropanol, butanol, 1-methoxy-2-propanol, and the like; C₁-C₄ chloroalkanes such as dichloromethane; C₁-C₄ ketones such as acetone; C₁-C₄ ethers such as anisole, and the like; cycloethers such as tetrahydrofuran; C₁-C₄ esters such as ethylacetate; C₁-C₄ sulfonates such as mesylate, ethanesulfonate,
30 butanesulfonate, 2-methyl-1-propanesulfonate; and the like.

Examples of mixtures of water and water miscible organic solvents include, mixtures of water with all organic solvents listed above provided they are miscible in water, e.g. ethanol/water, for instance in a 50/50 ratio.

35 Preferred solvents are those pharmaceutically acceptable solvents. However, pharmaceutically non-acceptable solvents may also find their use in the preparation of pharmaceutically acceptable pseudopolymorphs.

In a preferred method, the solvent is a pharmaceutically acceptable solvent since it results in a pharmaceutically acceptable pseudopolymorph. In a more preferred method, the solvent is ethanol.

- 5 In a particular embodiment, pharmaceutically acceptable pseudopolymorphs of compound of formula (X) can be prepared starting from pseudopolymorphic forms of compound of formula (X), which may not be necessarily pharmaceutically acceptable. For instance, Form A may be prepared starting from Form J. Pseudopolymorphs may also be prepared starting from the amorphous form.

10

In the mixtures of water and water miscible organic solvents, the amount of water can vary from about 5% by volume to about 95% by volume, preferably from about 25% to about 75% by volume, more preferably from about 40% to about 60% by volume.

- 15 It should also be noted that the quality of selected organic solvent (absolute, denaturated, or other) also influences the resulting quality of the pseudopolymorph.

Control of precipitation temperature and seeding may be additionally used to improve the reproducibility of the crystallization process, the particle size distribution and form of the product. As such, the crystallization can be effected without seeding with
20 crystals of the compound of the formula (X) or preferably in the presence of crystals of the compound of the formula (X), which are introduced into the solution by seeding. Seeding can also be effected several times at various temperatures. The amount of the seed material depends on the amount of the solution and can readily be determined by a
25 person skilled in the art.

The time for crystallization in each crystallization step will depend on the conditions applied, the techniques employed and/or solvents used.

- 30 Breaking up the large particles or aggregates of particles after crystal conversion may additionally be performed in order to obtain a desired and homogeneous particle size. Accordingly, the solvate crystal forms of compound of formula (X) are optionally milled after undergoing conversion. Milling or grinding refers to physically breaking up the large particles or aggregates of particles using methods and apparatus well
35 known in the art for particle size reduction of powders. Resulting particle sizes may range from millimeters to nanometers, yielding i.e. nanocrystals, microcrystals.

The yield of the preparation process of the pseudopolymorphs of compound of formula (X) may be 10% or more, a more preferred yield would vary from 40% to 100%.

Interestingly, the yield varies between 70% and 100%.

Suitably, pseudopolymorphs of the present invention have a purity greater than 90 percent. More suitably, the present pseudopolymorphs have a purity greater than 95 percent. Even more suitably, the present pseudopolymorphs have a purity greater than 99 percent.

In a third aspect, the present invention relates to a pharmaceutical formulation comprising a therapeutically effective amount of a pseudopolymorph of compound of formula (X), and a pharmaceutically acceptable carrier or diluent thereof.

In one embodiment, present invention relates to the use of pharmaceutically acceptable pseudopolymorphic forms of compound of formula (X), preferably Form A, in the manufacture of a medicament for treating diseases caused by retroviruses, such as HIV infections, for example, Acquired Immune Deficiency Syndrome (AIDS) and AIDS-related complex (ARC).

In another embodiment, present invention provides a method for the treatment of a retroviral infection, for example an HIV infection, in a mammal such as a human, which comprises administering to the mammal in need thereof an effective antiretroviral amount of a pharmaceutically acceptable pseudopolymorphic form of compound of formula (X), preferably Form A.

Present invention also relates to a method in which the treatment of a HIV viral infection comprises the reduction of HIV load. Present invention also relates to a method in which the treatment of said HIV viral infection comprises the increase of CD4+ cell count. Present invention relates as well to a method in which the treatment of said HIV viral infection comprises inhibiting HIV protease activity in a mammal.

Pharmaceutically acceptable pseudopolymorphic forms of compound of formula (X), preferably Form A, also referred to herein as the active pharmaceutical ingredients, may be administered by any route appropriate to the condition to be treated, preferably orally. It will be appreciated however, that the preferred route may vary with, for example, the condition of the recipient.

For each of the above-indicated utilities and indications the amount required of the active ingredient will depend upon a number of factors including the severity of the condition to be treated and the identity of the recipient and will ultimately be at the discretion of the attendant physician or veterinarian. The desired dose preferably may

be presented as one, two, three or four or more subdoses administered at appropriate intervals throughout the day.

For an oral administration form, pseudopolymorphs of the present invention are mixed with suitable additives, such as excipients, stabilizers or inert diluents, and brought by means of the customary methods into the suitable administration forms, such as tablets, coated tablets, hard capsules, aqueous, alcoholic, or oily solutions. Examples of suitable inert carriers are gum arabic, magnesia, magnesium carbonate, potassium phosphate, lactose, glucose, or starch, in particular, corn starch. In this case the preparation can be carried out both as dry and as moist granules. Suitable oily excipients or solvents are vegetable or animal oils, such as sunflower oil or cod liver oil. Suitable solvents for aqueous or alcoholic solutions are water, ethanol, sugar solutions, or mixtures thereof. Polyethylene glycols and polypropylene glycols are also useful as further auxiliaries for other administration forms.

For subcutaneous or intravenous administration, the pseudopolymorphs of compound of formula (X), if desired with the substances customary therefor such as solubilizers, emulsifiers or further auxiliaries, are brought into solution, suspension, or emulsion. The pseudopolymorphs of compound of formula (X) can also be lyophilized and the lyophilizates obtained used, for example, for the production of injection or infusion preparations. Suitable solvents are, for example, water, physiological saline solution or alcohols, e.g. ethanol, propanol, glycerol, in addition also sugar solutions such as glucose or mannitol solutions, or alternatively mixtures of the various solvents mentioned.

Suitable pharmaceutical formulations for administration in the form of aerosols or sprays are, for example, solutions, suspensions or emulsions of the pseudopolymorphs of compound of formula (X) in a pharmaceutically acceptable solvent, such as ethanol or water, or a mixture of such solvents. If required, the formulation can also additionally contain other pharmaceutical auxiliaries such as surfactants, emulsifiers and stabilizers as well as a propellant. Such a preparation customarily contains the active compound in a concentration from approximately 0.1 to 50%, in particular from approximately 0.3 to 3% by weight.

Pseudopolymorphs of the present invention may also be presented in a formulation comprising micrometer-, nanometer- or picometer-size particles of the pseudopolymorph of compound of formula (X), which formulation may contain other pharmaceutical agents and may optionally be converted to solid form.

It may be convenient to formulate the present pseudopolymorphs in the form of nanoparticles which have a surface modifier adsorbed on the surface thereof in an amount sufficient to maintain an effective average particle size of less than 1000 nm. Useful surface modifiers are believed to include those that physically adhere to the surface of the antiretroviral agent but do not chemically bind to the antiretroviral agent.

It may be further convenient to store the pseudopolymorphs of compound of formula (X) in packaging materials which are protective to mechanical, environmental, biological or chemical hazards, or degradation. Conditioning drug substances can be achieved by employing packaging materials impermeable to moisture, such as sealed vapour lock bags. Conditioning drug products, such as tablets, capsules, can be achieved by employing for instance, aluminium blisters.

It should be understood that in addition to the ingredients particularly mentioned above, formulations of this invention includes other agents conventional in the art having regard to the type of formulation in question, for example those suitable for oral administration may include flavouring agents or taste masking agents.

The following examples are intended for illustration only and are not intended to limit the scope of the invention in any way.

Example 1

The industrial scale synthesis of Form A (1:1) was performed using the following steps. First a solution was prepared with isopropanol and (3R,3aS,6aR)-hexahydrofuro [2,3-b] furan-3-yl (1S,2R)-3-[[[4-aminophenyl] sulfonyl] (isobutyl) amino]-1-benzyl-2-hydroxypropylcarbamate. The solution was concentrated by vacuum distillation at 70°C and 200-500mbar pressure and cooled from a T>35° to a T between 15° and 20° C for about 10 hours. The crystals formed were newly washed with 13 liters isopropanol and filtered. A subsequent recrystallization from ethanol/water (90 liters/90 liters) was performed. This was followed by a new dissolution step, but with 60 liters ethanol instead. Recrystallization of the reaction mixture from ethanol occurred, followed by a cooling step from reflux to -15°C approximately and during 10 hours. The ethanolate formed was filtered and let to dry at about 50°C and about 7 mbar. The yield of this process was at least 75%.

Example 2

In another example a mixture of Form D and Form B were prepared. Acetone was used as a solvent during the crystallisation process to form Form D. The crystallisation process then comprised the step of stirring the initial starting compound (10g) in 70ml

acetone. The solution was subsequently refluxed until the compound was completely solved. 40 ml of water were added and the solution was subsequently cooled slowly until room temperature and stirred overnight. Formed crystals were filtered and dried in the vacuum oven at 50°C. 7.6 g of product resulted from the crystallization, being
5 the yield of this process of about 75%.

Example 3

In another example Form J crystals were prepared. Isopropanol was used as a solvent during the crystallisation process to form Form J. The crystallisation process then
10 comprised the step of solving the initial starting material in the hot solvent. The solution was subsequently cooled until room temperature. Formed crystals were filtered and dried in the vacuum oven at 50°C. The crystals contained about 50 mol % isopropanol.

Example 4

In this example, the mass losses for different pseudopolymorphs in thermogravimetric (TG) experiments were calculated. Thermogravimetry is a technique that measures the change in mass of a sample as it is heated, cooled or held at constant temperature. Approximately 2 to 5 mg of sample were placed on a pan and inserted into the TG
20 furnace, model Netzsch Thermo-Microbalance TG 209 coupled to a Bruker FTIR Spectrometer vector 22. The samples were heated in a nitrogen atmosphere at a rate of 10°C/min, up to a final temperature of 250°C. The detection limit of residual solvents was in the order of 0.1% for distinct stepwise solvent loss over a narrow temperature range (few degrees Celsius).

25

The following TG data were obtained:

Form A: a weight loss of 4.2% was observed in the temperature range of 25-138°C (ethanol + little water) and of 6.9% (ethanol + CO₂) in the temperature range of 25-200°C. Ethanol loss rate was maximal at 120°C. CO₂ loss was due to chemical
30 degradation and was visible at around 190°C.

Form B: a weight loss of 3.4% was observed in the temperature range 25-78°C (water) and of 5.1% in the temperature range 25-110°C (ethanol + water for T>78°C). From 110-200°C further 1.1% weight was lost (ethanol).

35

Form C: a weight loss of 2.1% was observed in the temperature range 25-83°C (water + methanol) and of 4.2% in the temperature range 25-105°C (methanol for T>83°C, distinct step). From 105-200°C further 2.1% weight was lost (methanol). No ethanol was observed in the gas phase.

Form D: a weight loss of 0.1% was observed in the temperature range 25-50°C, of 4.2% in the temperature range 25-108°C (acetone + ethanol for T>50°C), of 8.2% in the temperature range 25-157°C (acetone + ethanol for T>108°C) and of 10.5% in the temperature range 25-240°C (acetone + ethanol for T>157°C).

Form E: a weight loss of 0.2% was observed in the temperature range 25-75°C (water), of 1.8% in the temperature range 25-108°C (dichloromethane + ethanol for T>75°C), of 6.8% in the temperature range 25-157°C (dichloromethane + ethanol for T>108°C) and of 8.8% in the temperature range 25-240°C (dichloromethane + ethanol for T>157°C).

Form F: a weight loss of 0.1% was observed in the temperature range 25-50°C (probably water), of 1.7% in the temperature range 25-108°C (ethylacetate + ethanol for T>50°C), of 6.6% in the temperature range 25-157°C (ethylacetate + ethanol for T>108°C) and of 9% in the temperature range 25-240°C (ethylacetate + ethanol for T>157°C).

Form G: a weight loss of 0.0% was observed in the temperature range 25-50°C, of 3.7% in the temperature range 25-108°C (1-methoxy-2-propanol + ethanol for T>50°C, distinct step), of 8% in the temperature range 25-157°C (1-methoxy-2-propanol + ethanol for T>108°C) and of 12.5% in the temperature range 25-240°C (1-methoxy-2-propanol + ethanol for T>157°C).

Form H: a weight loss of 0.8% was observed in the temperature range 25-100°C (anisole + little ethanol) and of 8.8% in the temperature range 25-200°C (anisole + ethanol for T>100°C).

Form I: a weight loss of 0.3% was observed in the temperature range 25-89°C (water) and of 11.0% in the temperature range 25-200°C (tetrahydrofuran for T>89°C). No ethanol was observed in the gas phase.

Table 10 shows approximate expected mass losses for different Forms in thermogravimetric (TG) experiments.

Mass loss in % ($M + x.LM = 100\%$)

| Pseudopolymorph | BP[°C] | Hemisolvate | Monosolvate | Disolvate | Trisolvate |
|-----------------|--------|-------------|-------------|-----------|------------|
| Form D | 56 | 5.0 | 9.6 | 17.5 | 24.1 |
| Form H | 152 | 9.0 | 16.5 | 28.3 | 37.2 |
| Form E | 40 | 7.2 | 13.4 | 23.7 | 31.8 |

| Pseudopolymorph | BP[°C] | Hemisolvate | Monosolvate | Disolvate | Trisolvate |
|-----------------|--------|-------------|-------------|-----------|------------|
| Form G | 119 | 7.6 | 14.1 | 24.8 | 33.1 |
| Form F | 76 | 7.4 | 13.9 | 24.3 | 32.6 |
| Form A | 78 | 4.0 | 7.8 | 14.4 | 20.2 |
| Form B | 100 | 1.6 | 3.2 | 6.2 | 9.0 |
| Form C | 65 | 2.8 | 5.5 | 10.5 | 14.9 |
| Form I | 66 | 6.2 | 11.6 | 20.8 | 28.3 |

In another set of thermogravimetric methods, Form A, Form A after Adsorption/Desorption, and Form A after Adsorption/Desorption hydration tests, were all transferred into an aluminum sample pan. The TG curve was recorded on a TA Instrument Hi-Res TGA 2950 thermogravimeter at the following conditions:

- initial temperature: room temperature
- heating rate: 20°C/min
- resolution factor: 4
- final condition: 300°C or <80[(w/w)%]

The TG curves of the samples are collected in Figure 16.

Table 11 shows mass losses for the forms tested:

| Form A | TG (% weight change) | |
|---------------------------------|----------------------|-------|
| | Up to 80°C | >80°C |
| Form A | 0.3 | 7.1 |
| Form A after ADS/DES | 2.9 | 4.0 |
| Form A after A/D hydration test | 5.4 | 0.5 |

The loss of weight at temperatures up to 80°C is mainly due to the evaporation of solvent (water) present in the sample. The loss of weight at temperatures above 80°C is mainly due to the evaporation of solvent (ethanolate) present in the sample.

A TG curve of form A at 25°C under dry nitrogen atmosphere in function of time is collected in Figure 17. The loss of weight at 25°C after 10 hours was around 0.6%. This was due to the evaporation of solvent.

Example 5

In another example, measurements of differential scanning calorimetry (DSC) were also performed. For such purpose, a Perkin Elmer DSC 204 thermal analysis system was used. From 2 to 5 mg sample of Form A were accurately weighed into a DSC pan.

- The experiments were performed in an open pan. The sample was equilibrated to approximately 30°C and then heated at a rate of 10°C per minute, up to a final temperature of 200° C. The DSC data was obtained following a standard method in the art. The Form A was characterized by differential scanning calorimetry (DSC) in which it showed a sharp endotherm in the range 80-119° C, showing a peak at about 105.6° C, with a delta H=-98.33 J/g onset. Accordingly, the ethanol solvate crystal Form A of compound of formula (X) (1:1) showed the thermograph pattern, which appears in FIGURE 8.
- In another set of DSC measurements, Form A, Form A after Adsorption/Desorption, and Form A after Adsorption/Desorption hydration tests were examined. About 3 mg of the samples were transferred into a 30 µl perforated aluminum Perkin Elmer sample pan. The sample pan was closed with the appropriate cover and the DSC curve recorded on a Perkin Elmer Pyris DSC, at the following conditions:
- initial temperature: 25°C
 - heating rate: 10°C/min
 - final temperature: 150°C
 - nitrogen flow: 30 ml/min
- Form A showed an endothermic signal at about 104.6°C and a heat of fusion of 95.8 J/g caused by the evaporation of the ethanolate and the melting of the product. Form A after ADS/DES showed a broad endothermic signal due to a mixture of ethanolate Form A and hydrated Form B. Form A after ADS/DES hydration test showed an endothermic signal at about 73.5°C and a heat of fusion of 126 J/g caused by the evaporation of water and the melting of the product. Thermograph curves are depicted in FIGURE 15.

Example 6

- In another example stability studies of the Form A in three different conditions were tested out. They included conditions of 25°C and 60% RH, 40°C and 75% RH, and 50°C. These studies revealed that at 25°C and 60% RH long-term stability, the amount of ethanol and water is stable.

- Table 12 shows the Stability study for Form A. Long term stability at 25°C / 60% RH (Relative Humidity), with brown glass bottles as sample container.

| Test | Release data | 0 month | 1 month | 3 month |
|-----------------------------------|--------------|---------|---------|---------|
| Residual solvent: % (w/w) ethanol | 7.5 | 7.6 | 7.6 | 7.1 |
| % (w/w) Water | 0.10 | 0.27 | 0.26 | 0.55 |

Example 7

Adsorption-Desorption tests

About 23 mg of Form A were transferred into a VTI vapor sorption analyzer model SGA100 and the weight change with respect to the atmospheric humidity was recorded at the following conditions:

- drying temperature: 40°C
- equilibrium: $\leq 0.05\%$ in 5min. or 60min.
- data interval: 0.05% or 2min.
- 10 ▪ temperature: 25°C
- first cycle RH (%) adsorption: 5, 10, 20, 30, 40, 50, 60, 70, 80, 90, 95
RH (%) desorption: 95, 90, 80, 70, 60, 50, 40, 30, 20, 10, 5
- second cycle RH (%) adsorption: 5, 10, 20, 30, 40, 50, 60, 70, 80, 90, 95
RH (%) desorption: 95, 90, 80, 70, 60, 50, 40, 30, 20, 10, 5

15

At the drying step about 0.6 % weight loss was registered. The obtained dried product was not hygroscopic, it adsorbed up to 0.7 % water at high relative humidity. During the desorption cycle a loss of weight of 1.4 % was registered, this indicated that the product was losing ethanolate. The obtained product after ADS/DES was a mixture of ethanolate form and hydrated form.

20

The ADS/DES curve is collected in Figure 18.

Adsorption-Desorption hydration tests

About 23 mg of Form A were transferred into a VTI vapor sorption analyzer model SGA100 and the weight change with respect to the atmospheric humidity was recorded at the following conditions:

- equilibrium: $\leq 0.0005\%$ in 5min. or 90min.
- data interval: 0.05% or 2min
- temperature: 25°C
- 30 ▪ cycle RH (%) adsorption/ desorption: 5.95
repeat the cycle 11 times

35

At the end of this test a loss of weight of 5.2% was registered. This was comparable with the TG result (TG 5.4% up to 80°C). The ethanolate form was transferred into a hydrated form. The ADS/DES hydration test curves are collected in Figure 19.

Example 8

The stability of Form A was studied after storage of the compound in a sample container with an inner cover made of single LD-PE (string sealed), and and outer

cover made of PETP/Alu/PE (Moplast) heat sealed. A long term stability study at 25°C / 60% RH, and an accelerated stability study at 40°C / 75%RH, were performed for a period of 6 months, and the samples analysed at different time points as shown in following tables.

Table 13: Long term stability at 25°C / 60% RH

10

Form A exhibited chemical and crystallographic stability at the conditions mentioned in tables 15 and 16.

Example 10

15 For the purpose of chemical stability testing, Form A was stored for a period of 1, 4 and

8 weeks under different conditions. These conditions were 40°C / 75%RH, 50°C, RT / <5%RH, RT / 56%RH, RT / 75%RH and 0.3da ICH light. The compound was analysed after storage by HPLC and by visual inspection. The HPLC method used in this study was HPLC method 909. The results of the tests are reported in the following table.

Table 17

| Conditions | HPLC Sum of impurities | | | Appearance | | |
|-----------------|---------------------------|--------|--------|-----------------|-----------------|-----------------|
| | 1 week | 4 week | 8 week | 1 week | 4 weeks | 8 weeks |
| Reference | 1.07 | - | - | slightly-yellow | - | - |
| 0.3da ICH light | 1.01 | - | - | slightly-yellow | - | - |
| 40°C / 75%RH | 1.03 | 0.98 | 0.99 | slightly-yellow | slightly-yellow | slightly-yellow |
| 50°C | 1.05 | 1.08 | 1.06 | slightly-yellow | slightly-yellow | slightly-yellow |
| RT / <5%RH | - | 1.02 | 1.04 | - | slightly-yellow | slightly-yellow |
| RT / 56%RH | - | 1.02 | 0.99 | - | slightly-yellow | slightly-yellow |
| RT / 75%RH | - | 1.00 | 1.01 | - | slightly-yellow | slightly-yellow |

It was concluded that Form A is chemically stable after storage in all investigated conditions.

Example 11

Different fractions of Form B were characterized with thermogravimetry (TG), differential scanning calorimetry (DSC) and infrared spectroscopy (IR). The results of the tests are reported in the following table.

Table 18

| Fractions | TG % weight change | IR | DSC | |
|-----------------------|-----------------------|-----------------------------|-------------|---------------|
| | <100°C | | Max (°C) | Extra (°C) |
| Form B fraction 1 | 5.65 | Hydrate, Ref | 69.1 | - |
| after ADS/DES | 4.30 | ± Hydrate, Ref, + amorphous | - | - |
| Form B fraction 2 | 5.91 | ~Hydrate, Ref | 75.6 | - |
| after 5d 40°C / 75%RH | 3.56 | ~Hydrate, Ref | 74.1 | - |
| Form B fraction 3 | 3.13 | ± Hydrate, Ref, + amorphous | 77.0 | 67.8 |
| after 5d 40°C / 75%RH | 2.33 | ± Hydrate, Ref, + amorphous | 77.4 | 62.8 |

~hydrate, Ref: identical with reference

Example 12

The adsorption and desorption of water at 25°C at different conditions of relative humidity was investigated on 38 mg of Form B. The weight change as a function of relative humidity was registered. The results are displayed in Figure 20. At the drying step about 5.6 % weight loss was registered for Form B. The obtained dried product was hygroscopic, it adsorbed up to 6.8 % water at high relative humidity. After the desorption cycle about 1.2 % water remained on the sample. The obtained product after ADS/DES was a mixture of hydrate and amorphous product.

Example 13

Aqueous solubilities of Form B were measured in solvents with different pH. An excess of the solute was equilibrated with the solvent at 20°C for at least 24 hours. After removing the undissolved compound, the concentration in solution was determined using UV spectrometry.

Table 19

| Solvent | Solubility (mg / 100 ml solution) | |
|---------------------------|-----------------------------------|-----------|
| Water | 10 | (pH 5.1) |
| Buffer pH 2 (citrate/HCl) | 23 | (pH 2.0) |
| Buffer pH 3 (citrate/HCl) | 13 | (pH 3.0) |
| Buffer pH 4 (citrate/HCl) | 12 | (pH 4.0) |
| 0.01N HCl | 18 | (pH 2.1) |
| 0.1N HCl | 150 | (pH 1.1) |
| 1.0N HCl | 510 | (pH 0.14) |

Example 14

The stability of the crystal structure of Form B was studied after storage of the compound for a period of two weeks at room temperature (RT) under <5 %, 56 % and 75 % relative humidity (RH), 50°C and 40°C/75%RH. The samples were analyzed with thermogravimetry (TG), differential scanning calorimetry (DSC), infrared spectroscopy (IR) and X-ray diffraction (XRD). The results of the tests are reported in the following table.

Table 20

| condition | TG | | IR | XRD | DSC | Appearance |
|---------------|--------|--------|------|-----|----------|------------------------|
| | <100°C | <225°C | | | Max (°C) | |
| 0 days | 5.65 | 0.16 | Ref | Ref | 69.1 | slightly yellow-orange |
| after ADS/DES | 4.30 | 0.18 | ≠Ref | - | - | slightly yellow-orange |

| condition | TG | | IR | XRD | DSC Max (°C) | Appearance |
|--------------|--------|--------|------|------|-----------------|------------------------|
| | <100°C | <225°C | | | | |
| RT/<5 % RH | 0.32 | 0.07 | ≠Ref | ≠Ref | 71.2 | slightly yellow-orange |
| RT/56%RH | 5.71 | 0.25 | ~Ref | ~Ref | 71.0 | slightly yellow-orange |
| RT/75 % RH | 6.20 | 0.10 | ~Ref | ~Ref | 71.5 | slightly yellow-orange |
| 50°C | 0.23 | 0.06 | ≠Ref | ≠Ref | 76.4 | slightly yellow-orange |
| 40°C/75 % RH | 5.77 | 0.07 | ~Ref | ±Ref | 70.4 | slightly yellow-orange |

~Ref: identical with reference

±Ref: similar with reference

≠Ref: different with reference

5 Example 15

In the chemical stability test program Form B was stored for a period of 1, 4 and 9 weeks under different conditions. These conditions were 40°C / 75%RH, 50°C, RT / <5%RH, RT / 56%RH, RT / 75%RH and 0.3da ICH light. The compound was analysed after storage by HPLC and by visual inspection. The HPLC method used in this study was HPLC method 909. The results of the tests are reported in the following table, from which it was concluded that Form B is chemically stable.

Table 21

| Condition | HPLC | | | Appearance | | |
|-----------------|-------------------|--------|--------|-----------------------|-----------------------|--------------|
| | Sum of impurities | | | 1 week | 4 weeks | 9 weeks |
| | 1 week | 4 week | 9 week | | | |
| Reference | 1.35 | - | - | lightly yellow-orange | - | - |
| 0.3da ICH light | 1.30 | - | - | light-orange | - | - |
| 40°C / 75%RH | 1.43 | 1.38 | 1.41 | lightly yellow-orange | Orange | light-orange |
| 50°C | 1.46 | 1.50 | 1.46 | lightly yellow-orange | light-orange | light-orange |
| RT / <50%RH | - | 1.48 | 1.37 | - | light-orange | light-orange |
| RT / 56%RH | - | 1.11 | 1.35 | - | lightly yellow-orange | light-orange |
| RT / 75%RH | - | 1.34 | 1.29 | - | light-orange | light-orange |

15 Example 16

Form K was prepared by adding neat methanesulfonic acid to a solution of Form A in

THF at r.t. Form K was subsequently mixed with alkali halide and pressed to a pellet (Ph. Eur.) and analyzed by Infrared spectrometry (IR) at the following conditions:

- apparatus: Nicolet Magna 560 FTIR spectrophotometer
- number of scans: 32
- 5 ▪ resolution: 1 cm^{-1}
- wavelength range: $4000\text{ to }400\text{ cm}^{-1}$
- baseline correction: yes
- detector: DTGS with KBr windows
- beamsplitter: Ge on KBr
- 10 ▪ alkali halide: KBr (potassium bromide)

The IR spectrum of Form K, as shown in Figure 21, reflects the vibrational modes of the molecular structure of the mesylate solvate as a crystalline product.

15 Table 22

10 (¹) vs = very strong, s = strong, m = medium, w = weak, vw = very weak

Example 18

About 3 mg of Form K were transferred into a standard aluminium TA-Instrument sample pan. The sample pan was closed with the appropriate cover and the DSC curve recorded on a TA-Instruments Q1000 MTDSC equipped with a RCS cooling unit, at the following conditions:

- initial temperature: 25°C
- heating rate: 10°C/min
- final temperature: 200°C
- 20 ▪ nitrogen flow: 50 ml/min

The DSC curve as depicted in Figure 23, shows the melting with decomposition of a crystalline product. The melting of Form K occurs at 158.4°C. Due to the decomposition, the heat of fusion calculation can only be used to indicate the crystalline property of the product.

25

Example 19

Form K was transferred into an aluminum sample pan. The TG curve was recorded on

a TA Instruments Hi-Res TGA 2950 thermogravimeter at the following conditions:

- initial temperature: room temperature
- heating rate: 20°C/min
- resolution factor: 4
- 5 ▪ final condition: 300°C or <80[(w/w)%]

The TG curve is exhibited in Figure 24. The loss of weight of around 0.2% up to 60°C was due to the evaporation of solvent. The loss of weight at temperatures above 140°C was due to the evaporation and decomposition of the product.

10

Example 20

Adsorption-Desorption

About 21 mg of Form K were transferred into a VTI vapor sorption analyzer model SGA100 and the weight change with respect to the atmospheric humidity was recorded

15 at the following conditions:

- | | |
|---------------------|--|
| drying temperature: | 40°C |
| equilibrium: | ≤0.05% in 5min. or 60min. |
| data interval: | 0.05% or 2.0min. |
| temperature: | 25°C |
| 20 first cycle | RH (%) adsorption: 5,10,20,30,40,50,60,70,80,90,95 RH (%) desorption: 95,90,80,70,60,50,40,30,20,10,5 |
| second cycle | RH (%)adsorption: 5,10,20,30,40,50,60,70,80,90,95 RH (%) desorption: 95,90,80,70,60,50,40,30,20,10,5 |

25 The Adsorption-Desorption isotherm is shown in Figure 25. Form K is hygroscopic. At the initial drying step a loss of weight of 0.3 % was registered, comparable to the TG result. Form K adsorbed up to 1.5% water at high relative humidity. The product dried completely during the desorption cycle.

30 A different study of the adsorption and desorption of water by Form K at 25°C at different conditions of relative humidity was investigated on an amount of about 18 mg of the mesylate solvate. The weight change as a function of relative humidity was registered. The result is displayed in Figure 26.

35 At the drying step about 0.6 % weight loss is registered for Form K. The obtained dried product is slightly hygroscopic, it adsorbed up to 1.7 % water at high relative humidity. The product dried completely during the desorption cycle.

Example 21

Aqueous solubilities of Form K were measured in solvents with different pH. An excess of the solute was equilibrated with the solvent at 20°C for at least 48 hours.

- 5 After removing the undissolved compound, the concentration in solution was determined using UV spectrometry.

Table 24

| Solvent | Solubility (mg / 100 ml solution) | |
|----------------------------|-----------------------------------|----------|
| Water | 19 | (pH 3.3) |
| Buffer pH 2 (citrate/HCl) | 21 | (pH 2.0) |
| Buffer pH 3 (citrate/HCl) | 12 | (pH 3.0) |
| Buffer pH 4 (citrate/HCl) | 11 | (pH 4.0) |
| 0.01N HCl | 24 | (pH 2.0) |
| 20% HP β CD in water | 2100 | (pH 1.6) |

Example 22

- The stability of the crystal structure of Form K batch 1 was studied after storage of the compound for a period of four weeks at room temperature (RT) under 75% relative humidity (RH), 50°C and 40°C / 75%RH. The stability of the crystal structure of Form K batch 2 was studied after storage of the compound for a period of four weeks at room temperature (RT) under <5 %, 56% and 75% relative humidity (RH), 50°C and 40°C / 75%RH. The samples were analyzed with thermogravimetry (TG), differential scanning calorimetry (DSC) and infrared spectroscopy (IR). The results of the tests are reported in the following table.

Table 25

| compound | conditions | TG | | IR | DSC | | Appearance |

| | | 1 week | 4 weeks | 1 week | 4 weeks |
| Form K batch 1 | Reference | 3.57 | - | slightly-orange | - |
| | 0.3da ICH light | 2.93 | - | slightly-orange | - |
| | 40°C/75 % RH | 5.36 | >90* | slightly-orange | brown oil |
| | 50°C | 3.99 | 27.53 | slightly-orange | orange |
| | RT/75 % RH | - | 3.61 | - | slightly-orange |
| Form K Batch 2 | Reference | 1.50 | - | slightly-orange | - |
| | 0.3da ICH light | 1.17 | - | slightly-orange | - |
| | 40°C/75 % RH | 1.75 | >85* | slightly-orange | brown oil |
| | 50°C | 1.46 | 1.25 | slightly-orange | slightly-orange |
| | RT/<5 % RH | - | 1.58 | - | slightly-orange |
| | RT/56 % RH | - | 1.45 | - | slightly-orange |
| | RT/75 % RH | - | 1.46 | - | slightly-orange |

Example 24

A randomized, placebo-controlled, double-blind, multiple dose escalation trial was performed to examine the safety, tolerability and pharmacokinetics of Form A after oral administration twice or three times daily, in healthy subjects. Four dosages of Form A (400 mg b.i.d., 800 mg b.i.d., 800 mg t.i.d., and 1200 mg t.i.d.) were tested in 4 panels of 9 healthy subjects. Within each panel, 6 subjects were treated with Form A and 3

subjects with placebo for 13 days with a single intake in the morning of day 14. (b.i.d.= twice daily, t.i.d. = three times daily).

5 Form A was readily absorbed and concentration-time profiles of Form A after repeated dosing were dependent on the dose administered. Steady-state plasma concentrations were reached generally within 3 days, although C_{0h} (conc. at administration time) and AUC_{24h} (area under de curve or bioavailability) slightly decreased over time at all dose levels. AUC_{24h} and $C_{ss,av}$ (conc. at average steady-state) were dose-proportional (daily dose) at 400 mg b.i.d., 800 mg t.i.d. and 1200 mg t.i.d., but was more than dose-
10 proportional at 800 mg b.i.d. C_{max} (maximum conc.) was dose-proportional with respect to dose per intake. Less than 2% of unchanged Form A was excreted in the urine at all dose levels.

CLAIMS

1. A pseudopolymorph of (3R,3aS,6aR)-hexahydrofuro [2,3-b] furan-3-yl (1S,2R)-3-
[[[4-aminophenyl) sulfonyl] (isobutyl) amino]-1-benzyl-2-hydroxypropylcarbamate.
5
2. A pseudopolymorph according to claim 1, wherein the pseudopolymorph is a
hydrate solvate, alcohol solvate, alkane solvate, ketone solvate, ether solvate,
cycloether solvate, ester solvate, sulfonic solvate.
- 10 3. A pseudopolymorph according to any one of claims 1 to 2, wherein the
pseudopolymorph is a hydrate solvate, C₁-C₄ alcohol solvate, C₁-C₄ chloroalkane
solvate, C₁-C₅ ketone solvate, C₁-C₄ ether solvate, cycloether solvate, C₁-C₅ ester
solvate, C₁-C₄ sulfonic solvate.
- 15 4. A pseudopolymorph according to claim 1, wherein the pseudopolymorph is a
hydrate solvate, alcohol solvate, alkane solvate, ketone solvate, ether solvate,
cycloether solvate, ester solvate.
- 20 5. A pseudopolymorph according to any one of claims 1 to 4, which is
pharmaceutically acceptable.
6. A pseudopolymorph according to claim 1, wherein the pseudopolymorph is chosen
from Form A (ethanolate), Form B (hydrate), Form C (methanolate), Form D
(acetate), Form E (dichloromethanate), Form F (ethylacetate solvate), Form G
25 (1-ethoxy-2-propanolate), Form H (anisolate), Form I (tetrahydrofuranate), Form J
(isopropanolate), Form K (mesylate).
7. A pseudopolymorph according to claim 1, wherein the pseudopolymorph is chosen
from Form A (ethanolate), Form B (hydrate), Form C (methanolate), Form D
30 (acetate), Form E (dichloromethanate), Form F (ethylacetate solvate), Form G
(1-ethoxy-2-propanolate), Form H (anisolate), Form I (tetrahydrofuranate), Form J
(isopropanolate).
8. A pseudopolymorph according to claim 1, wherein the pseudopolymorph is Form A
35 (ethanolate), Form B (hydrate).
9. A pseudopolymorph according to any one of claims 1 to 8, in which the ratio of
compound to solvent ranges between (5:1) and (1:5).

10. A pseudopolymorph according to claim 9, in which the ratio of compound to solvent is about 1:1.
- 5 11. A pseudopolymorph according to any one of claims 1 to 10, additionally comprising water molecules.
- 10 12. A process for preparing a pseudopolymorph according to any one of claims 1 to 11 comprising the steps of combining (3R,3aS,6aR)-hexahydrofuro [2,3-b] furan-3-yl (1S,2R)-3-[[[4-aminophenyl] sulfonyl] (isobutyl) amino]-1-benzyl-2-hydroxypropylcarbamate with an organic solvent, water, or mixtures of water and water miscible organic solvents, and inducing crystallization.
- 15 13. Pharmaceutical composition comprising a pseudopolymorph according to any one of claims 1 to 11 and a pharmaceutically acceptable carrier and/or diluent.
14. Use of a pseudopolymorph of any one of claims 1 to 11 in the manufacture of a medicament for inhibiting HIV protease activity in a mammal.

Minimum documentation searched (classification system followed by classification symbols)

IPC 7 C07D

Documentation searched other than minimum documentation to the extent that such documents are included in the fields searched

Electronic data base consulted during the international search (name of data base and, where practical, search terms used)

EPO-Internal, WPI Data, PAJ, CHEM ABS Data

C. DOCUMENTS CONSIDERED TO BE RELEVANT

| Category * | Citation of document, with indication, where appropriate, of the relevant passages | Relevant to claim No. |
|------------|--|-----------------------|
| Y | <p>GRUNENBERG A ET AL: "THEORETICAL DERIVATION AND PRACTICAL APPLICATION OF ENERGY/TEMPERATURE DIAGRAM AS AN INSTRUMENT IN PREFORMULATION STUDIES OF POLYMORPHIC DRUG SUBSTANCES" INTERNATIONAL JOURNAL OF PHARMACEUTICS, AMSTERDAM, NL, vol. 129, 1996, pages 147-158, XP000909867 ISSN: 0378-5173</p> <p>* see page 147, introduction *</p> <p>the whole document</p> <p style="text-align: center;">---</p> <p style="text-align: center;">-/--</p> | 1-14 |

Further documents are listed in the continuation of box C.

Patent family members are listed in annex.

* Special categories of cited documents :

- "A" document defining the general state of the art which is not considered to be of particular relevance
- "E" earlier document but published on or after the international filing date
- "L" document which may throw doubts on priority claim(s) or which is cited to establish the publication date of another citation or other special reason (as specified)
- "O" document referring to an oral disclosure, use, exhibition or other means
- "P" document published prior to the international filing date but later than the priority date claimed

- "T" later document published after the international filing date or priority date and not in conflict with the application but cited to understand the principle or theory underlying the invention
- "X" document of particular relevance; the claimed invention cannot be considered novel or cannot be considered to involve an inventive step when the document is taken alone
- "Y" document of particular relevance; the claimed invention cannot be considered to involve an inventive step when the document is combined with one or more other such documents, such combination being obvious to a person skilled in the art.
- "&" document member of the same patent family

Date of the actual completion of the international search

19 March 2004

Date of mailing of the international search report

30/03/2004

Name and mailing address of the ISA

European Patent Office, P.B. 5818 Patentlaan 2
 NL - 2280 HV Rijswijk
 Tel. (+31-70) 340-2040, Tx. 31 651 epo nl,
 Fax: (+31-70) 340-3016
